Highlights

Industrial product and raw materials price indexes

Led by higher prices for petroleum products, manufacturers' prices, as measured by the Industrial Product Price Index (IPPI), rose in January (+0.3%) following two months of decrease. On an annual basis, the IPPI rose 2.0%, its sixth consecutive increase.

Petroleum product prices influence on the IPPI

12-month % change

From a monthly perspective, higher prices for petroleum and coal products (+7.5%) had a major impact, followed to a lesser degree by chemical products (+1.2%), primary metal products (+0.9%) and meat, fish and dairy products (+0.7%). Lower prices for motor vehicles and other transport equipment (-1.1%), pulp and paper products (-1.0%) and electrical and communication products (-0.7%) partly offset those monthly increases.

Strong contributors to the year-over-year growth were petroleum and coal products (+32.4%) and primary metal products (+6.7%). Fruit, vegetable and feed products (+4.5%) and chemical products (+3.3%) also contributed to the annual growth in manufacturers' prices. However, lower prices for motor vehicles and other transport equipment (-2.8%), pulp and paper products (-3.0%) and lumber and other wood products (-3.2%) dampened the increase.

From January 2002 to January 2003, petroleum and coal product prices rose 32.4%, the largest year-over-year increase since November 2000. If petroleum and coal product prices had been excluded, the year-over-year increase would have been 0.2% instead of 2.0%.

Manufacturers paid 22.2% more for their raw materials than they did in January 2002, following an increase of 18.6% in December. Higher prices for mineral fuels (+46.7%) were mainly responsible for this annual rise in the Raw Materials Price Index (RMPI). Increases for vegetable products, wood products and animal products also contributed to the annual increase. If mineral fuels had been excluded, the RMPI would have increased 6.4%.

On a monthly basis, raw materials prices were up 5.2% from December. Mineral fuels were the major contributors to the monthly increase, with prices up 9.8%. Prices for animal products, more specifically cattle and hogs, were also higher in January than in December. Vegetable products partly offset this monthly increase, mainly as a result of lower prices for canola, soybeans and wheat.

The IPPI (1997=100) stood at 108.4 in January, up from its revised level of 108.1 in December. The RMPI (1997=100) rose to 125.6 in January from its revised level of 119.4 in December.

Crude oil prices continue to influence RMPI

12-month % change

Monthly crude oil prices are up but prices for lumber products are down slightly

In the RMPI, crude oil prices were 11.3% higher in January than in December, mainly the result of concerns over supply and colder winter temperatures. On a year-over-year basis, crude oil prices were up 64.0%, the largest increase since June 2000.

In the IPPI, lumber and other wood product prices were down slightly (-0.1%) from December. Lower prices for softwood lumber were offset by higher prices for particleboard and softwood plywood. On an annual basis, lumber and other wood products prices were down 3.2%.

Impact of exchange rate pushes down prices

From December to January, the value of the US dollar weakened against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars. As a result, the total IPPI excluding the effect of the exchange rate would have increased 0.7% instead of 0.3%.

On a 12-month basis, the influence of the dollar had a larger impact. The IPPI excluding the effect of the exchange rate would have increased 2.9% rather than 2.0% from January 2002 to January 2003.

Finished goods continue to increase from a year ago

Rising prices for petroleum products, tobacco products, meat, fish and dairy products and fruit, vegetable and feed products pushed year-over-year prices for finished goods up 0.7% from January 2002. These increases were partly offset by lower prices for motor vehicles as well as electrical and communication products.

On a monthly basis, prices for finished goods were down slightly (-0.1%) from December. Lower prices for motor vehicles and electrical and communication products were mainly offset by higher prices for petroleum products and meat, fish and dairy products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Prices for intermediate goods increase

Producers of intermediate goods received 2.8% more for their goods in January than in January 2002, the fifth consecutive year-over-year increase. Higher prices for petroleum products, primary metal products, fruit, vegetable and feed products and chemical products were the major contributors to this annual rise. Lower prices for lumber products, pulp and paper products and motor vehicles partly offset this increase.

Prices for intermediate goods rose 0.5% from December. Higher prices for petroleum products, primary metal products and chemical products were partly offset by lower prices for motor vehicles, pulp and paper products and fruit, vegetable and feed products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

- 1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor. The numeric descriptor is of the order ss-mm-nn-pppp-rr where
- ss indicates the S-level commodity code (from 9 to 28)
 - mm indicates the M-level commodity code (from 14 to 43, 45 to 69)
 - nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details
 - pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)
 - rr indicates a split of a PCGA.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are «must take» respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the «Make» matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Perspectives on Labour and Income!

Bringing you insight into the Canadian labour market and the incomes of Canadians

An organization's strength is measured by its human resources. How do you position your organization to meet the latest innovative developments in today's workplace while ensuring it realizes its full potential?

With *Perspectives on Labour and Income (PLI)* you get the latest trends, research and data on work issues — up close. *PLI* is THE tool used by labour and human resources professionals, management consultants, academics and others.

Delivering a major boost to your productivity!

PLI is one of the most effective tools to help you understand, analyze, measure and manage human capital. Clearly designed charts, tables and summaries reveal the latest labour and demographic statistics, essential to:

- ▶ **develop winning recruiting strategies**
- ▶ **compare your organization within your industry**
- ▶ **determine how attitudes toward retirement influence investment decisions**
- ▶ **forecast the effect of employment on the demand for goods and services or social programs**

...and much more!

Keep a firm hand on the pulse of the marketplace

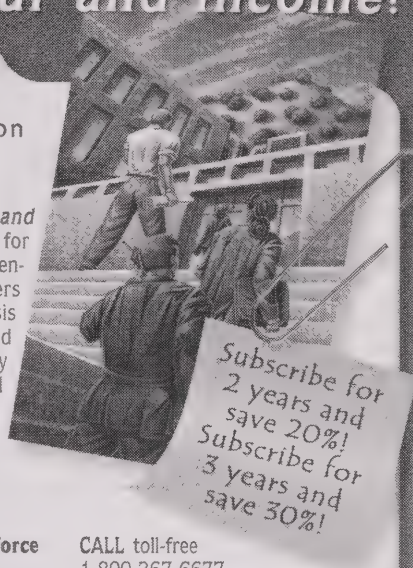

Perspectives on Labour and Income meets your needs for accurate, timely and comprehensive information. *PLI* delivers vital data, articles and analysis on workplace and related issues facing contemporary Canada. This quarterly journal examines:

- ▶ **self-employment patterns**
- ▶ **regional trends of employment**
- ▶ **the aging of the labour force**
- ▶ **savings and spending patterns**
- ▶ **earnings and income in Canada**
- ▶ **technological change affecting the workplace**
- ...and many other subjects!**

Order *Perspectives on Labour and Income* TODAY!

Order the quarterly print version of *Perspectives on Labour and Income* (Cat. No. 75-001-XPE) and get the latest research and analysis on workplace issues for just \$58 a year.

PLI is also available online in a new monthly electronic version (75-001-XIE). For \$48 a year, you get at least one full-length article released each month on Statistics Canada's Web site, www.statcan.ca.

WORK FROM A DIFFERENT

What do Canadians eat?

Are you a nutritionist, food industry analyst, market researcher or a consumer who needs to know what Canadians are eating? If the answer is yes, then the publication ***Food Consumption in Canada*** will meet your needs.

This two-part publication offers:

- comprehensive coverage on consumption patterns of numerous foods and beverages;
- data on our food supply from farm production, processing and imports;
- information on how much food is exported, used by processors and held in storage;
- fifteen years of data at your fingertips;
- analysis and graphs illustrating trends and changes in eating patterns.

How much meat, cheese and other dairy products are Canadians eating? Are we drinking more low-fat milk? How much alcohol, tea and coffee are Canadians drinking? Has our consumption of sugar, eggs, rice and nuts changed over time? If you are curious about these

questions, then *Part 1* (catalogue 32-229-XPB) will be of interest to you. For information on consumption patterns for fruit, vegetables, fish, butter and salad oils, see *Part II* (catalogue 32-230-XPB). Each publication is \$35 and now contains the data tables for all commodities. In Canada, please add **either** GST and applicable PST **or** HST. Shipping charges: No shipping charges for delivery in Canada. For shipments to the United States, please add \$6 per publication. For shipments to other countries, please add \$10 per publication.

Highlights

Industrial product and raw materials price indexes

Higher prices for petroleum products continue to influence the change in manufacturers' prices, as measured by the Industrial Product Price Index (IPPI). The IPPI increased 0.6% in February, following a 0.3% rise in January. On an annual basis, the IPPI rose 2.3%, its seventh consecutive increase.

Petroleum product prices continue to influence the IPPI

12-month % change

From a monthly perspective, higher prices for petroleum and coal products (+10.0%) had a major impact, followed to a lesser degree by lumber and other wood products (+1.1%), primary metal products (+0.7%) and meat, fish and dairy products (+0.5%). Lower prices for motor vehicles and other transport equipment (-0.8%), electrical and communication products (-0.5%) and pulp and paper products (-0.2%) partly offset these monthly increases.

The major contributor to the year-over-year growth was petroleum and coal products, which rose 44.1%, their largest year-over-year increase since June 2000. If petroleum and coal product prices had been excluded, the IPPI would have remained unchanged instead of increasing 2.3%.

Price increases for primary metal products (+6.6%), chemical products (+4.2%) and fruit, vegetable and feed products (+4.7%) also contributed to the annual growth in manufacturers' prices. However, lower prices for motor vehicles and other transport equipment (-3.5%), lumber and other wood products (-6.2%), pulp and paper products (-1.9%) and electrical and communication products (-2.4%) dampened the increase.

Manufacturers paid 22.6% more for their raw materials than they did in February 2002, following an increase of 21.6% in January. Higher prices for mineral fuels (+49.6%) were mainly responsible for this annual rise in the Raw Materials Price Index (RMPI). Increases for vegetable products and wood products also contributed to the annual increase. If mineral fuels had been excluded, the RMPI would have increased 4.8%.

On a monthly basis, raw materials prices were up 3.1% from January. Mineral fuels were the major contributors to the monthly increase with prices rising 6.5%. Prices for non-ferrous metals and for wood products were also higher in February than in January. Vegetable products partly offset this monthly increase, mainly as a result of lower prices for barley and canola.

The IPPI (1997=100) stood at 109.2 in February, up from its revised level of 108.6 in January. The RMPI (1997=100) rose to 128.9 in February, up from its revised level of 125.0 in January.

Crude oil prices continue to influence RMPI

12-month % change

Monthly prices for crude oil and for lumber products are up

In the RMPI, crude oil prices were 7.9% higher in February than in January, mainly the result of declining inventories and colder-than-normal temperatures. On a year-over-year basis, crude oil prices were up 67.5%.

In the IPPI, lumber and other wood product prices were up 1.1% in February from January. Higher prices for softwood lumber were the main contributors to the monthly increase, mainly because of more demand and some stockpiling in anticipation of spring construction activity. On an annual basis, lumber and other wood products prices were down 6.2%.

Impact of exchange rate pushes down prices

From January to February, the value of the US dollar weakened against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars. As a result, the total IPPI excluding the effect of the exchange rate would have risen 0.9% instead of 0.6%.

On a 12-month basis, the influence of the dollar had a larger impact. The IPPI excluding the effect of the exchange rate would have increased 3.6% rather than 2.3% from February 2002 to February 2003.

Prices for intermediate goods continue to increase

Producers of intermediate goods received 3.6% more for their goods in February than they did in February 2002, the sixth consecutive year-over-year increase. Higher prices for petroleum products, primary metal products, fruit, vegetable and feed products as well as chemical products were the major contributors to this annual rise. Lower prices for lumber products, motor vehicles, pulp and paper products as well as electrical and communications products partly offset this increase.

Prices for intermediate goods rose 0.9% from January. Higher prices for petroleum products, primary metal products, pulp and paper products and chemical products were partly offset by lower prices for motor vehicles and electrical and communication products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods continue to increase from a year ago

Rising prices for petroleum products, tobacco products, meat, fish and dairy products as well as fruit, vegetable and feed products pushed year-over-year prices up 0.7% from February 2002 for finished goods. These increases were partly offset by lower prices for motor vehicles and for electrical and communication products.

On a monthly basis, prices for finished goods were up 0.2% from January. Higher prices for petroleum products and for meat, fish and dairy products were mainly offset by lower prices for motor vehicles and for electrical and communication products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its U.S. counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

- 1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor. The numeric descriptor is of the order ss-mm-nn-pppp-rr where
- ss indicates the S-level commodity code (from 9 to 28)
 - mm indicates the M-level commodity code (from 14 to 43, 45 to 69)
 - nn indicates the N-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details
 - pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)
 - rr indicates a split of a PCGA.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum_i w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

Reference Documents

62-558-XPB Industry Price Indexes, 1986=100: Users' Guide, \$40.00.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

62-556-XPB Industrial Product Price Indexes, 1981=100, Concepts and Methods, \$25.00.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \frac{\sum_i w^i}{\sum_i w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices weakened in March, falling 0.5% after two consecutive months of growth. On an annual basis, the Industrial Product Price Index (IPPI) rose 1.3%, the smallest increase since September 2002.

Petroleum product prices still influence the IPPI

12-month % change

From a monthly perspective, lower prices for motor vehicles and other transport equipment (-1.8%) were the major factor in the decline of the IPPI. A decrease in lumber and other wood products (-3.1%) was due mainly to falling demand for softwood lumber, coupled with higher inventories and declining prices for plywood. Primary metal products also fell (-1.5%). Higher prices for petroleum and coal products (+1.8%), chemical products (+1.0%), and meat, fish and dairy products (+0.6%) partly offset these monthly decreases.

The petroleum and coal products group continued to be the major influence on the year-over-year growth in the IPPI, with an increase of 37.6%. If petroleum and coal product prices had been excluded, the IPPI would have declined 0.8% instead of increasing 1.3% on a year-over-year basis.

In addition to petroleum and coal products, price increases for chemical products (+6.4%), fruit, vegetable and feed products (+4.1%) and primary metal products (+3.1%) also contributed to the annual growth in manufacturers' prices. However, lower prices for motor vehicles and other transport equipment (-5.1%), lumber and other wood products (-13.2%, the largest decrease since March 2001), and electrical and communication products (-2.9%) dampened the increase.

Raw materials prices also weaken

On a monthly basis, raw materials prices were down 4.0% from February. Mineral fuels were the major contributors to the monthly decrease in the Raw Materials Price Index (RMPI), with prices declining 6.7%. Crude oil prices were 8.3% lower in March than in February, mainly the result of increased production and a drop in demand with the arrival of more spring-like temperatures. Prices for vegetable products (more specifically wheat and canola), non-ferrous metals and wood products were also lower in March than in February. Higher prices for animal products helped offset this monthly decrease.

Manufacturers paid 11.9% more for their raw materials than they did in March 2002, compared with an increase of 22.8% in February. Higher prices for mineral fuels (+23.2%) were mainly responsible for this annual rise in the RMPI. On a year-over-year basis, crude oil prices rose 29.9%, nowhere near the 67.5% increase experienced in February. Prices for wood products, vegetable products and animal products were also up on an annual basis. If mineral fuels had been excluded, the RMPI would have increased 3.6%.

Crude oil prices continue to influence RMPI

12-month % change

The IPPI (1997=100) stood at 108.8 in March, down from its revised level of 109.4 in February. The RMPI (1997=100) was 124.0 in March, down from its revised level of 129.1 in February.

Impact of exchange rate continues to push down prices

From February to March, the value of the US dollar weakened against the Canadian dollar; this pushed down prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have risen 0.1% instead of decreasing 0.5%.

On a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 3.1% rather than 1.3% from March 2002 to March 2003.

Prices for intermediate goods continue to increase on an annual basis

Prices for intermediate goods declined 0.4% from February. Lower prices for lumber products, motor vehicles, primary metal products and electrical and communication products were partly offset by higher prices for petroleum products, chemical products, pulp and paper products, and meat, fish and dairy products.

Producers of intermediate goods received 2.6% more for their goods in March than in March 2002. Higher prices for petroleum products, chemical products, fruit, vegetable and feed products and primary metal products were the major contributors to this annual rise. Lower prices for lumber products, motor vehicles, pulp and paper products, and electrical and communication products partly offset this increase.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease from a year ago

On a monthly basis, prices for finished goods were down 0.8% from February. Lower prices for motor vehicles and electrical and communication products were the major contributors to this decrease.

Declining prices for motor vehicles and electrical and communication products pushed prices down 0.4% from March 2002. These decreases were partly offset by higher prices for fruit, vegetable and feed products, meat, fish and dairy products, petroleum products and tobacco products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

Note: Indexes for the most recent six months shown are subject to revision.

1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor.

The numeric descriptor is of the order ss-mm-nn-pppp-rr where

ss indicates the S-level commodity code (from 9 to 28)

mm indicates the M-level commodity code (from 14 to 43, 45 to 69)

nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details

pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)

rr indicates a split of a PCGA.

Note: Indexes for the most recent six months shown are subject to revision.

1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.

2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are «must take» respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the «Make» matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

62-556-XPB Industrial Product Price Indexes, 1981=100, Concepts and Methods, \$25.00.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

For further details, please contact Prices Division, Statistics Canada, Ottawa, Ontario K1A 0T6, telephone (613) 951-9606, facsimile (613) 951-1539, Internet address infounit@statcan.ca.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices weakened 1.4% in April, in large part because of a stronger Canadian dollar relative to the US dollar. On an annual basis, the Industrial Product Price Index (IPPI) declined 0.1%, after eight months of increases.

Petroleum product prices still influence the IPPI

12-month % change

From a monthly perspective, lower prices for petroleum and coal products (-9.7%) and motor vehicles and other transport equipment (-1.6%) were the major contributors to the decline of the IPPI. A decrease in lumber and other wood products (-1.4%) was due mainly to lower demand for softwood lumber, coupled with declining prices for particleboard and plywood. Primary metal products also fell (-2.6%). Higher prices for pulp and paper products (+0.6%), tobacco products (+2.6%) as well as rubber, leather and plastic fabricated products (+0.6%) partly offset these monthly decreases.

The petroleum and coal products group continued to be a major influence on the year-over-year change in the IPPI, with an increase of 18.0%. If petroleum and coal product prices had been excluded, the IPPI would have declined 1.3% instead of 0.1% on a year-over-year basis.

In addition to petroleum and coal products, price increases for chemical products (+6.4%), fruit, vegetable and feed products (+4.1%), and meat, fish and dairy products (+2.8%) were offset by price decreases for motor vehicles and other transport equipment (-6.2%), lumber and other wood products (-13.4%), and electrical and communications products (-3.8%).

Raw materials prices also weaken

On a monthly basis, raw materials prices were down 6.5% from March. Mineral fuels were the major contributors to the monthly decrease in the Raw Materials Price Index (RMPI), with prices declining 12.5%. Crude oil prices were 15.8% lower in April than in March, mainly the result of higher production and a drop in demand. Prices for non-ferrous metals, vegetable products and ferrous materials were also lower in April.

Manufacturers paid 3.4% more for their raw materials than they did in April 2002, compared with increases of 12.2% in March and 23.3% in February. Higher prices for animal products (+7.9%) and mineral fuels (+2.5%) were mainly responsible for this annual rise in the RMPI. On a year-over-year basis, crude oil prices were up 2.6%, their lowest year-over-year increase since July 2002. Prices for vegetable products, wood products and non-metallic minerals were also up on an annual basis. If mineral fuels had been excluded, the RMPI would have increased 4.1%.

The IPPI (1997=100) stood at 107.6 in April, down from its revised level of 109.1 in March. The RMPI (1997=100) was 116.2 in April, down from its revised level of 124.3 in March.

Crude oil prices had less influence on the RMPI

12-month % change

Impact of exchange rate continues to push down prices

From March to April, the value of the US dollar weakened against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have decreased 0.8% instead of 1.4%.

On a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 2.4% rather than declining 0.1% from April 2002 to April 2003.

Prices for intermediate goods continue to increase on an annual basis

Prices for intermediate goods declined 1.5% from March. Lower prices for petroleum products, motor vehicles, lumber products, primary metal products and chemical products were partly offset by higher prices for pulp and paper products and rubber, leather and plastic fabricated products.

Producers of intermediate goods received 0.9% more for their goods in April than in April 2002. Higher prices for petroleum products, chemical products, fruit, vegetable and feed products and pulp and paper products were the major contributors to this annual rise. Lower prices for lumber products, motor vehicles, primary metal products, and electrical and communications products partly offset this increase.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease from a year ago

On a monthly basis, prices for finished goods were down 1.2% from March. Lower prices for petroleum products, motor vehicles, and electrical and communications products were the major contributors to this decrease.

Declining prices for motor vehicles and electrical and communications products pushed year-over-year prices down 1.6% from April 2002. These decreases were partly offset by higher prices for petroleum products, tobacco products, fruit, vegetable and feed products, and meat, fish and dairy products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor.

The numeric descriptor is of the order ss-mm-nn-pppp-rr where

ss indicates the S-level commodity code (from 9 to 28)

mm indicates the M-level commodity code (from 14 to 43, 45 to 69)

nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details

pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)

rr indicates a split of a PCGA.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the «Make» matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w^i are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Perspectives on Labour and Income!

Bringing you insight into the Canadian labour market and the incomes of Canadians

An organization's strength is measured by its human resources. How do you position your organization to meet the latest innovative developments in today's workplace while ensuring it realizes its full potential?

With *Perspectives on Labour and Income (PLI)* you get the latest trends, research and data on work issues — up close. *PLI* is THE tool used by labour and human resources professionals, management consultants, academics and others.

Delivering a major boost to your productivity!

PLI is one of the most effective tools to help you understand, analyze, measure and manage human capital. Clearly designed charts, tables and summaries reveal the latest labour and demographic statistics, essential to:

- ▶ **develop winning recruiting strategies**
- ▶ **compare your organization within your industry**
- ▶ **determine how attitudes toward retirement influence investment decisions**
- ▶ **forecast the effect of employment on the demand for goods and services or social programs**

...and much more!

Keep a firm hand on the pulse of the marketplace

Perspectives on Labour and Income meets your needs for accurate, timely and comprehensive information. *PLI* delivers vital data, articles and analysis on workplace and related issues facing contemporary Canada. This quarterly journal examines:

- ▶ **self-employment patterns**
- ▶ **regional trends of employment**
- ▶ **the aging of the labour force**
- ▶ **savings and spending patterns**
- ▶ **earnings and income in Canada**
- ▶ **technological change affecting the workplace**
- ...and many other subjects!**

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices weakened 2.0% in May from April, in large part because of a stronger Canadian dollar relative to the US dollar. On an annual basis, the Industrial Product Price Index (IPPI) declined 1.7% from May 2002, following a 0.4% decline in April.

From a monthly perspective, lower prices for motor vehicles and other transport equipment (-3.7%) and petroleum and coal products (-6.5%) were the major contributors to the decline of the IPPI. A decrease in lumber and other wood products (-2.5%) was due to oversupply and lower demand for softwood lumber, as well as declining prices for plywood. Prices for pulp and paper products also fell (-2.5%), as did those for electrical and communication products (-2.0%).

Petroleum product prices still influence the IPPI

12-month % change

On an annual basis, lower prices for motor vehicles and other transport equipment (-8.2%), lumber and other wood products (-13.4%), and electrical and communication products (-5.3%) were the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group continued to be an influence on the year-over-year change in the IPPI, with an increase of 7.1%. If petroleum and coal product prices had been excluded, the IPPI would have declined 2.3% instead of decreasing 1.7% on a year-over-year basis.

In addition to petroleum and coal products, prices for chemical products (+5.2%), meat, fish and dairy products (+3.8%), and fruit, vegetable and feed products (+3.6%) were also up from May 2002.

Raw materials prices also weaken

On a monthly basis, raw materials prices were down 2.5% from April. Mineral fuels were the major contributors to the monthly decrease in the Raw Materials Price Index (RMPI), with prices declining 3.8%. Crude oil prices were 4.9% lower in May than in April. Prices for wood products, vegetable products and ferrous materials were also lower.

Manufacturers paid 0.5% less for their raw materials than they did in May 2002, compared with increases of 3.1% in April and 12.3% in March. Lower prices for mineral fuels (-2.7%) were mainly responsible for this annual drop in the RMPI. On a year-over-year basis, crude oil prices were down 3.9%, their first year-over-year decrease since June 2002. Prices for non-ferrous metals, wood products and ferrous materials were also down on an annual basis. These decreases were partly offset by higher prices for animal products and non-metallic minerals. If mineral fuels had been excluded, the RMPI would have increased 1.3%.

Crude oil prices had less influence on the RMPI

12-month % change

The IPPI (1997=100) stood at 105.2 in May, down from its revised level of 107.3 in April. The RMPI (1997=100) was 113.0 in May down from its revised level of 115.9 in April.

Impact of exchange rate continues to push down prices

From April to May, the value of the US dollar continued to weaken against the Canadian dollar, pushing down prices of commodities that are quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate would have decreased 0.5% instead of 2.0%.

On a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.6% rather than declining 1.7% in May from May 2002.

Prices for intermediate goods decrease on an annual basis

Prices for intermediate goods declined 1.8% from April. Lower prices for petroleum products, motor vehicles, lumber products as well as pulp and paper products were the major contributors to the decline.

Producers of intermediate goods received 0.9% less for their goods in May than in May 2002. Lower prices for lumber products, motor vehicles, electrical and communication products, and pulp and paper products were partly offset by higher prices for petroleum and chemical products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from a year ago

On a monthly basis, prices for finished goods were down 2.2% from April. Lower prices for motor vehicles, petroleum products, lumber products as well as electrical and communication products were the major contributors to this decrease.

Declining prices for motor vehicles as well as electrical and communication products pushed year-over-year prices down 2.9% from May 2002. These decreases were partly offset by higher prices for tobacco products, petroleum products, chemical products, fruit, vegetable and feed products, and meat, fish and dairy products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index (IPPI)** reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index (RMPI)** reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

- 1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor. The numeric descriptor is of the order ss-mm-nn-pppp-rr where
- ss indicates the S-level commodity code (from 9 to 28)
 - mm indicates the M-level commodity code (from 14 to 43, 45 to 69)
 - nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details
 - pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)
 - rr indicates a split of a PCGA.

Note: Indexes for the most recent six months shown are subject to revision.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's The Daily approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.

Highlights

Industrial product and raw materials price indexes

Manufacturers' prices weakened 1.0% in June and fell 2.7% on an annual basis, largely due to the strength of the Canadian dollar against the US dollar. If the impact of the Canadian dollar were removed, the Industrial Product Price Index (IPPI) would have risen 1.2% rather than falling 2.7% from a year ago.

From a monthly perspective, lower prices for motor vehicles and other transport equipment (-2.1%), pulp and paper products (-1.8%) and primary metal products (-1.5%) were the major contributors in the decline of the IPPI. Prices for chemical products also fell (-1.3%), as well as those for electrical and communication products (-1.0%). Prices for lumber products were up 1.3% from May as a result of decreased production due to mill shutdowns.

Petroleum product prices have less influence on the IPPI

12-month % change

On an annual basis, lower prices for motor vehicles and other transport equipment (-9.7%), lumber and other wood products (-7.9%) and electrical and communication products (-6.2%) were the major contributors to the year-over-year decline in the IPPI.

The petroleum and coal products group continues to be an influence on the year-over-year change in the IPPI, with an increase of 4.1%. If petroleum and coal product prices had been excluded, the IPPI would have declined 3.1% instead of decreasing 2.7% on a year-over-year basis.

In addition to petroleum and coal products, prices for chemical products (+3.1%), meat, fish and dairy products (+2.9%), tobacco products (+17.4%) as well as fruit, vegetable and feed products (+2.1%) were also up compared with a year ago.

Crude oil fuels a modest rise in raw materials prices

On a monthly basis, raw materials prices were up 1.2% from May. Mineral fuels were the only contributors to the monthly increase in the Raw Materials Price Index (RMPI), with prices increasing 4.9%. Crude oil prices were 6.5% higher in June than in May, mainly the result of lower inventories. Lower prices for wood products, vegetable products, non-ferrous metals as well as ferrous materials partly offset the monthly increase. Prices for animal products were also down slightly (-0.2%) as price decreases for fresh fish and cattle were offset by increased prices for hogs.

Manufacturers paid 3.2% more for their raw materials than they did in June last year, compared with a decrease of 0.6% in May. Higher prices for mineral fuels (+8.8%) were mainly responsible for this annual rise in the RMPI. On a year-over-year basis, crude oil prices were up 8.0%, following a year-over-year decrease of 3.9% in May. Prices for animal products and non-metallic minerals were also up on an annual basis. These increases were partly offset by lower prices for wood products, non-ferrous metals, vegetable products and ferrous materials. If mineral fuels had been excluded, the RMPI would have decreased 1.0%.

The IPPI (1997=100) stood at 103.9 in June, down from its revised level of 104.9 in May. The RMPI (1997=100) was 114.3 in June, up from its revised level of 112.9 in May.

Crude oil prices still influence the RMPI

12-month % change

Impact of exchange rate continues to push down prices

From May to June, the value of the US dollar continued to weaken against the Canadian dollar pushing down prices of commodities quoted in US dollars, notably motor vehicles and lumber products. As a result, the total IPPI excluding the effect of the exchange rate, would have decreased 0.1% instead of 1.0%.

On a 12-month basis, the influence of the dollar is much stronger. Consequently, the IPPI excluding the effect of the exchange rate would have increased 1.2% rather than declining 2.7% from June 2002 to June 2003.

Prices for intermediate goods decrease on an annual basis

Prices for intermediate goods declined 0.9% from May. Lower prices for motor vehicles, pulp and paper products, chemical products, primary metal products as well as petroleum products were the major contributors to the decline.

Producers of intermediate goods received 1.8% less for their goods in June compared with the same month last year. Lower prices for motor vehicles, lumber products, pulp and paper products, as well as electrical and communication products, were partially offset by higher prices for petroleum and chemical products.

"Intermediate goods," sometimes referred to as "input goods," are goods that are generally bought by manufacturers to be further used in the production process, that is, to make other goods.

Finished goods decrease again from the previous year

On a monthly basis, prices for finished goods were down 1.1% from May. Lower prices for motor vehicles, electrical and communication products, machinery and equipment, pulp and paper products as well as chemical products were the major contributors to this decrease.

Declining prices for motor vehicles, electrical and communication products, machinery and equipment, as well as pulp and paper products, pushed year-over-year prices down 3.8% from June 2002. These decreases were partly offset by higher prices for tobacco products, meat, fish and dairy products, fruit, vegetable and feed products, petroleum products, as well as chemical products.

"Finished goods" are those generally purchased for the purpose of either consumption or investment. Most of the foods and feeds category ends up in the hands of consumers. Most capital goods are equipment and machinery generally bought by companies, government agencies, or governments. Much of the remainder is bought by consumers.

Note to readers

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often quote their prices in foreign currencies, particularly for motor vehicles, pulp, paper, and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI.

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of these prices are set in a world market. Unlike the IPPI, the RMPI includes goods not produced in Canada.

1) The bottom line in each series title block may contain, in order from left to right, the following: the CANSIM series number (v nnnnnnn) and a numeric descriptor.

The numeric descriptor is of the order ss-mm-nn-pppp-rr where

ss indicates the S-level commodity code (from 9 to 28)

mm indicates the M-level commodity code (from 14 to 43, 45 to 69)

nn indicates the M-level commodity split, or 91, which indicates a special aggregation or 99, which indicates special details

pppp indicates the PCGA code (except for some special aggregations which include several PCGAs)

rr indicates a split of a PCGA.

- 1) The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match.
- 2) The numeric code to the right of the CANSIM series number on the last line of each series is the 1997 North American Industry Classification System (NAICS) code.

Explanation of methods used and additional sources for industrial price indexes

Industrial Product Price Indexes (1997=100)

The Industrial Product Price Indexes (IPPI) measure price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 980 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 1997 Input/Output (I/O) table. Weights used to aggregate commodity indexes are taken from the output or "Make" matrix of the I/O system which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (Catalogue 11-001-XIE) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in Tables 329-0038 to 329-0049 or by request.

Each release of numbers is subject to revision for six months, i.e., when a July index is released, the index for the preceding January becomes final. Exceptions to this rule are announced.

Price Surveys

About 9,000 prices are collected monthly from about 3,000 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 12 to 15 price quotes. An index may be derived from as few as 8 quotes or as many as 30 quotes.

About 700 of the 980 PCGAs in the manufacturing sector are accommodated by direct survey and these account for about 90% of the value of manufacturing output in 1997.

The price movement for the other PCGAs is estimated indirectly from either directly priced PCGAs or through borrowing price movement from other price series.

Weight Base

Commodity and industry weights are taken from the "Make" matrix of the 1997 Input/Output table which, in turn, is derived from 1997 values reported for the Survey of Manufacturers and edited to conform to the 1997 North American Industry Classification System. However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns.

Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where w are the values of the output of each commodity:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in the base period;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Historical Data

Historical series on the 1997 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 1997 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. The historical series were obtained by linking together movements from the 1997-based Industrial Product Price Indexes (IPPI) series and the corresponding 1992-based Industrial Product Price Indexes (IPPI) series, using 1997 as the linking period. A set of concordance tables between both sets of IPPI series are available to the public.

This publication describes briefly the economic content of the series and presents a short description of different aggregations produced. In the tables the weighting patterns (1986) for both commodities and commodity groupings are shown. Descriptions of the characteristics of the elemental indexes are provided. Comments on index use are also provided.

62-556-XPB Industrial Product Price Indexes, 1981=100, Concepts and Methods, \$25.00.

This publication describes the economic content of the series within the framework of the system of national accounts and describes how this affects price index methodology. Sampling and pricing methods are described, as are index calculation and aggregation procedures. A glossary of terms is also provided.

Raw materials price indexes (1997 = 100)

The Raw Materials Price Indexes (RMPI) measure price changes for the purchase of raw materials by Canadian industry. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product (e.g. metal scrap). For example, wheat is considered as a raw material, but wheat flour is not, iron ore is but not pig iron, coal but not electricity. Approximately eighty commodities are priced in the index, grouped into seven major components.

The index and the major group indexes, on a 1997 time base, are published monthly in Statistics Canada's *The Daily* approximately four weeks after the end of the reference month. They are also available at that time on CANSIM in Table 330-0006.

Historical Data

The new historical series were obtained by linking together movements from the 1997-based Raw Material Price Indexes (RMPI) series and the corresponding 1992-based Raw Material Price Indexes (RMPI) series, using the year 1997 as the linking period. An explanatory note on the methods used to compute the historical series, as well as a set of concordance tables between both sets of RMPI series are available to the public.

Coverage

The index covers purchases of imported and domestically produced goods by Canadian industry, generally for further processing, and does not cover exports or flows of raw materials directly to final demand (principally foodstuffs). For example, potatoes bought by food processing manufacturers (for the manufacture of potato chips, or frozen french fries) are included in the index, but those bought by consumers directly are not.

As a purchasers' price index, prices should include all charges purchasers incur to bring a commodity to the establishment gate. Thus transportation charges, taxes net paid and custom duties are all included. So also are the effects of subsidies, if any are paid to the purchaser.

While prices are ideally collected from the purchaser, there are several cases where other well known prices are used instead: for example, marketing board prices for eggs and milk, and stockyard prices for some livestock. In a few cases, where data for unprocessed materials are not

available, prices are taken for a similar commodity at the next stage of processing as occurred for some non-ferrous metals. A detailed description of the characteristics of prices for any commodity is available from Prices Division on request.

Prices collected each month are those in effect on the 15th of the month or the nearest prior business day. In a few cases, prices used are averages for the week which includes the 15th. Prices are reported directly to Statistics Canada or are taken from trade publications or from publications of other government departments.

Weight Base

Weights were derived from the 1997 Input/Output tables which provide values at purchasers' prices of commodities purchased as intermediate inputs.

Within individual commodity indexes, the prices are weighted according to their market share in a recent year. In a few instances, where data are not available, the price quotations are equally weighted.

Formula

Indexes for aggregates of individual raw materials are calculated according to the following formula:

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$ denotes the composite price index movement between the base period o and time t for the defined aggregate;

w^i is the transaction value of the element i in 1997;

$P_{t/o}^i$ is the price index for element i , meaning its price change from the base period o to time t ;

\sum_i indicates summation over all elements i in the defined aggregate.

Electric Power Selling Price Indexes, Non-residential, (1997=100)

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 1997 as a time reference base and the weights used are 1992 company revenues from sales of electricity, as collected by Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 1997=100. The indexes are available on CANSIM in Table 329-0050. Indexes for the current year and the previous year are subject to revision.
